Try our resources for FREE! NO OBLIGATIONS, NO LOOPHOLES AND NO AUTO-ENROLMENT

eInspection Copies and Boost eBook and digital resource trials are completely free and allow you to review our resources for 30 days. Get started now in three easy steps:

- 1 Find title(s) at hachettelearning.com, select 'eInspection Copy' or 'Trial' and add to your basket.
- 2 Proceed to the checkout (no payment details required). If you don't already have an account with us, you'll need to set one up – it's quick, easy and free to do.
- 3 Access details for your eInspection Copy/Trial will be emailed to you. If you pre-order a forthcoming title, you'll receive an email upon publication when the eInspection Copy/trial is available.

Publication dates were correct at the time of producing this catalogue.

To check the latest publication dates, use the ISBNs listed in this catalogue to search for titles on our website.

Classwork, homework, smart work.

Take learning and teaching for the Cambridge curriculum to the next level with MySmartCourse.

A best-in-class digital teaching and learning solution that adapts to each child's needs and ability both inside and outside the classroom.

- ✔ Save time with a centralised resource bank and data-driven insights that bridge knowledge gaps and empower informed teaching
- ✔ Transform lessons with interactive front-of-class resources
- ✔ Support the 'whole' learner through wellbeing checks
- ✔ Drive engagement and make learning accessible with additional support resources for EAL learners.

Launching 2026 for Primary and Lower Secondary.

We're looking for schools to join our pre-launch trial. To register your interest, contact international.sales@hachettelearning.com

2 DATA TRANSMISSION

Computer 'B' will now have to reassemble the packets into the original sequence.

▲ Figure 2.5 Typical network showing possible paths taken by each packet

The benefits of packet switching are:

- there is no need to tie up a single communication line
- it is possible to overcome failed, busy or faulty lines by simply re-routing packets
- it is relatively easy to expand package usage
- a high data transmission rate is possible.

The drawbacks of packet switching include:

- packets can be lost and need to be re-sent
- the method is more prone to errors with **real-time streaming** (for example, a live sporting event being transmitted over the internet)
- there is a delay at the destination whilst the packets are being re-ordered.

Sometimes it is possible for packets to get lost because they keep 'bouncing' around from router to router and never actually reach their destination. Eventually the network would just grind to a halt as the number of **lost packets** mount up, clogging up the system. To overcome this, a method called **hopping** is used. A **hop number** is added to the header of each packet, and this number is reduced by 1 every time it leaves a router (Figure 2.6).

▲ Figure 2.6 Hop numbers between routers

Each packet has a maximum hop number to start with. Once a hop number reaches zero, and the packet hasn't reached its destination, the packet is deleted when it reaches the next router. The missing packet is then re-sent by the receiving computer and a request to re-send the packet.

Find out more

Another method of sending packets is called circuit switching. Find out how this differs to packet switching, and then re-draw Figure 2.5 showing the route the packets take when using circuit switching.

Advice

Hopping is not included on the syllabus but is included here for completeness to help understand how packets can get lost.

2.1 Types and methods of data transmission

Activity 2.1

- Suppose a video conference is taking place between delegates in two different countries. Packet switching is being used to send video and sound data between the delegates:

▲ Figure 2.7

Describe:

- any potential problems with sound and video quality
- how these problems could be caused.
- Explain how packet switching could be used to download a large web page from a website.
- The trailer in a packet will use one form of error checking. Explain what is meant by a cyclic redundancy check.

b The payload contains the following data:

11110000 10000011 00110011 00111111 11111110 11100011

Use this data to show how the receiving computer can verify that the received payload was error-free.

- Explain how it is possible for packets to be lost during their transmission across a network.
- Describe how it is possible for a system to deal with lost packets and prevent them from slowing down the transmission process.
- Explain why you think packet switching might improve data security.

2.1.2 Data transmission

Data transmission can be either over a short distance (for example, computer to printer) or over longer distances (for example, from one computer to another in a global network). Essentially, three factors need to be considered when transmitting data:

- the direction of data transmission (for example, can data transmit in one direction only, or in both directions)
- the method of transmission (for example, how many bits can be sent at the same time)
- how will data be synchronised (that is, how to make sure the received data is in the correct order).

These factors are usually considered by a communication protocol.

Navigate the syllabus confidently with introductions to each topic outlining the learning objectives

7 The systems life cycle

In this chapter you will learn about the:

- analysis stage:
 - methods of analysing the current system
 - identifying the inputs, outputs and processing in the current system
 - hardware and software requirements for the new system
- design stage:
 - file structures, input and output formats
 - use of data capture forms
 - screen and report layouts
 - validation routines
- development and testing stage:
 - test strategies and test plans
 - use of test data (including live data)
- implementation stage:
 - parallel running
 - pilot running
 - phased implementation
- documentation stage:
 - technical documentation
 - user documentation
- evaluation stage:
 - evaluation of new solution
 - compare solution to original system.

In this chapter we will consider the stages and processes involved when replacing computer systems, from analysis of an existing system right through to evaluation of the new system.

Suppose a company has been using an existing computer system for a number of years. They have decided to replace the current system with a new one. After a number of years of successful operation, what would initiate this need to upgrade?

- The existing computer equipment is now obsolete (it cannot be repaired anymore).
- Changes to laws or taxes requiring radical overhaul of software.
- More suitable hardware is now available to improve efficiency and reliability.
- There is a need to expand the company.

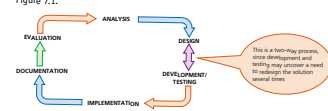

There could be many more reasons.

The changes will involve an ICT solution, which means a **systems analyst** needs to be brought in to oversee the whole upgrade process. Their first task is to analyse the existing (current) system, and then suggest a number of ways that can be made. All these improvements need to be costed against the current system need to be reported back to the management team.

7 THE SYSTEMS LIFE CYCLE

Once a new system is agreed and it has been fully tested, it is then installed. It then needs to be fully evaluated and any changes made where necessary. Therefore, a cycle of events take place until a fully-working system is signed off and handed over to the management team. This whole process is called the **systems life cycle**.

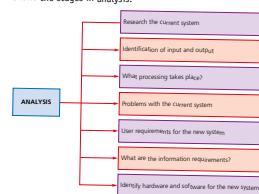

There are many stages in the systems life cycle, which have been summarised in Figure 7.1.

▲ Figure 7.1 Systems life cycle

7.1 Analysis

The first stage in the process is the analysis of the current system. Figure 7.2 shows the stages in analysis.

▲ Figure 7.2 Analysis stage

7.1.1 Analyse the current system

There are four methods used to research the current system. The four methods used are:

- observation
- questionnaires
- interviews
- examination of existing documents.

Artificial intelligence

Unit 8.4

Testing conditions: Developing games

Get started!

Have you ever played a game where you had to make choices? Discuss the following with a partner:

- What sort of decisions did you make in the last game you played?
- Did you notice that the game progresses differently, depending on which choices you made?
- Have you ever played a game that contained bugs?

Computer programs need to be able to check user choices and other conditions. They also need to be tested to make sure that the program runs correctly for everyone. In this unit, you will use Python to develop and test computer games that run different sections of code, depending on the user's input.

Learning outcomes

In this unit, you will learn to:

- create and follow a flowchart that uses conditional statements
- develop programs in Python that use conditional statements
- understand how AND, OR and NOT can be used in algorithms
- develop programs in Python that use AND, OR and NOT
- develop programs in Python using different data types
- develop programs using an iterative process
- develop and apply a test plan
- understand the need for using a range of test data
- test a program using suitable test data.

Warm up

In pairs, think about your journey to school this morning. What conditions did you or your parents have to check before leaving home? For example:

- Have you eaten any food?
- Have you brushed your teeth?
- Is your schoolbag packed?
- Are the doors locked?

Make a list of all the conditions you can both think of.

Most computer programs also check conditions as they are running. The conditions depend on what the program does. In this unit, you will see how a game, written in Python, checks conditions to allow a player to move through it. You will also see how important it is to test the game, so that it works correctly for every possible choice.

4

Unit 8.4 Testing conditions: Developing games

SCENARIO

Younger children need to understand the importance of secure passwords. Your school wishes to promote online safety and, as a programmer, you have been asked to create a **text adventure game** for young children aged 8–10 years old. The game should provide the children with some different pathways to follow as they progress through a story.

The child will play the main character in the game. They need to find the Chocolate Room in a sweet shop. They will meet a robot and the sweet-shop owner on their journey.

When they find and enter the Chocolate Room, there will be two questions. If the child answers the questions correctly, they will be given three letters from a four-letter password. They then have to guess the password, after being given a clue. If they guess the password correctly, they open a digital treasure chest and win the game.

Your challenge is to examine existing **program code** and find out what it does, correct errors in the code and complete the game.

You need to use the different sample code provided by your teacher.

You will add new code, edit code and test any changes made to the code to make sure that it works correctly.

DID YOU KNOW?

The first adventure games for computers were text adventure games. This was because the computers were not powerful enough to display good graphics. A famous example is the game Zork, which you can still play online today. Search for one of the early Zork games online to find out the quality of the graphics computers of that time could display.

KEYWORDS

text adventure game:

a game in which the player types in

commands to control

the main character

program code: the

Python code created in

the IDLE

arithmetic operators:

+, -, *, / and other

symbols that can be

used for arithmetic

Do you remember?

Before starting this unit, you should be able to:

- ✓ create an algorithm using flowchart symbols
- ✓ understand the logic of AND, OR and NOT
- ✓ understand the difference between integer, real and string data types
- ✓ know how to develop programs in Python with inputs and outputs
- ✓ use variables in Python
- ✓ use **arithmetic operators** in Python
- ✓ to debug a program.

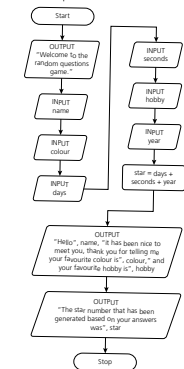

Develop computational thinking throughout the activities.

5

CAMBRIDGE LOWER SECONDARY COMPUTING 7 TEACHER'S GUIDE

Answers

1 For example:

2 See 7.1.7 Challenge Yourself (Teacher).py for a possible solution.

Review

- Provide 7.1.7 Worksheet 20. Ask students identify the output based on the values given using the flowchart. The flowchart has sub-routines and can be used to check understanding of flowcharts with sub-routines.
- For answers, refer to 7.1.7 Worksheet 20 Answers.

Homework

- Provide 7.1.7 Worksheet 21 electronically, if possible. Students are asked to create a flowchart for the scenario given using sub-routines.
- See 7.1.7 Worksheet 21 Answers for a solution.

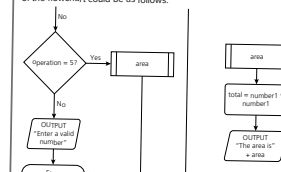

44

7.1 Block it out: Moving from blocks to text

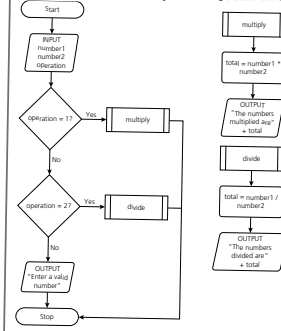

Differentiation

Go further

Stretch: Some students may be able to add options to their flowchart, e.g. area of a square, perimeter of a rectangle, etc. to add further complexity to the flowchart solution, e.g. an extension of the flowchart could be as follows:

Support: Ask these students to focus just on creating the sub-routines for multiplication and division, e.g.
